

SabiCard Seller Guide

A practical walkthrough for seller account access, live card creation, NFC encoding, customer activation, credit rules, and platform conditions.

Live demo card:

SC758300

Seller account:

sabicardapp@gmail.com

Application:

<https://www.sabicard.app>

Customer activation:

Completed with a live guide account

Quick Start Checklist

- 1 Sign in to the approved seller account.
- 2 Confirm available seller credits.
- 3 Generate or enter a Card UID.
- 4 Click **Register and Use 1 Credit**.
- 5 Encode the NFC card using Encode NFC or Copy URL.
- 6 Test the physical card before release.
- 7 Give the card to the customer.
- 8 Customer creates/signs in and confirms activation.
- 9 Confirm the card appears as activated in Seller Cards.

Seller Workflow

1. Seller Account Registration

A seller starts with a normal SabiCard account. Seller privileges are granted by the platform after review.

1. Open the registration page.

Create your account

Get started with SabiCard

Sign up with Google

4. Create a Live Card

This guide created a live card record in production. The seller uses the generated Card UID and clicks **Register and Use 1 Credit**.

Card used in this guide: **SC758300**. One credit was consumed when this card was successfully registered.

Encode NFC

Marker 1 shows the button that registers the live card and deducts one credit.

After registration, the card appears in the Seller Cards list. At this stage the card is ready to be encoded or copied into an NFC writer.

The screenshot displays the SabiCard Seller Dashboard. On the left is a sidebar with navigation links: GENERAL (Dashboard, My Card, Leads, Analytics) and SELLER (Seller Dashboard, highlighted), ACCOUNT (Settings, Help), and a Sign Out button. The main content area is titled 'Seller Dashboard' with a subtitle 'Register NFC cards, spend credits, and monitor customer activations.' and a Refresh button. Below this are four summary cards: Credits (96), Total Cards (2), Unactivated (1), and Activated (1). The 'Register Card' section includes a 'Generate UID' button, a 'Card UID' input field with the value 'SC905318', a 'Card Type' dropdown set to 'Standard', and a '+ Register and Use 1 Credit' button. The 'Seller Cards' section features a search bar and a status filter set to 'All Statuses'. It lists two cards: SC758300 (unactivated) and SC933528 (active). Each card entry shows a Tap URL, customer name, and creation time, along with 'Copy URL' and 'Encode NFC' buttons. A green notification banner at the top right states 'Card SC758300 registered. 1 credit was used.'

6. Encode the NFC Card

The seller writes the card tap URL to the physical NFC card. On supported devices, use **Encode NFC**. If Web NFC is unavailable, use **Copy URL** and write it with another NFC writer.

1. Use Chrome on Android over HTTPS with NFC enabled for Web NFC writing.
2. Keep the physical card close to the phone until writing completes.
3. Test the card by tapping it after encoding.

Marker 1 shows Copy URL. Marker 2 shows Encode NFC.

The customer taps the encoded card, signs in or creates an account, and confirms activation. The card becomes assigned to that customer and remains linked to the seller who registered it.

Marker 1 shows the customer confirmation button for the live card.

8. Activation Complete

After confirmation, SabiCard opens the activated card destination or dashboard. The seller dashboard can now count the card as activated.

How Credits Work

- One successful card registration consumes one seller credit.
- Credits are deducted when the seller registers the card in SabiCard, not when the customer later activates it.
- Failed NFC writing does not deduct another credit because the card record already exists.
- Credit changes are tracked in a ledger for audit history.

Operational Policy

- Sellers should confirm the card UID and tap URL before giving cards to customers.
- A card should not be reused for multiple customers after activation.
- Replacement cards normally require a new card registration and credit unless SabiCard grants a support adjustment.
- Suspended sellers cannot issue new cards until reactivated by SabiCard.

Credit Ledger Example

The seller credit balance is calculated from a ledger. Every top-up and every card registration creates a transaction record.

Action	Credit Change	Balance
Admin adds seller credits	+100	100
Seller registers one card	-1	99
Seller registers another card	-1	98
Admin support adjustment	+1	99

Recommended Setup

- Android phone with NFC support.
- Chrome browser.
- NFC enabled in device settings.
- Stable internet connection.
- Writable NFC card or tag.
- SabiCard opened over HTTPS.

Important Notes

- Browser-based NFC writing may not work on all iPhones.
- If Web NFC is unavailable, use Copy URL and a compatible NFC writer app.
- Keep the card still near the phone until writing completes.
- Always test the card before giving it to the customer.

Card Testing Procedure

1. After encoding, tap the physical card with a phone.
2. Confirm the URL opens <https://www.sabicard.app/tap?uid=...>
3. Confirm an unassigned card redirects to activation.
4. Do not activate the card using the seller account.
5. Give the card to the customer only after the tap test succeeds.

Issue	Likely Cause	Recommended Action
NFC writing is not supported	Browser or device does not support Web NFC.	Use Chrome on Android over HTTPS, or copy the tap URL and write it with another NFC writer app.
Seller has no credits	Credit balance is zero.	Contact SabiCard admin to top up seller credits before registering more cards.
Card tap opens the wrong page	Wrong URL was encoded to the physical NFC card.	Copy the tap URL from the seller dashboard and rewrite the NFC card.
Card is already activated	The card was claimed by a customer account.	Do not reuse the card. Contact support if activation was accidental or disputed.
Card registered but not encoded	The digital card exists but the physical NFC tag was not written.	Find the card in Seller Cards, then use Encode NFC or Copy URL.
Customer cannot log in	Incorrect password, unverified email, or account issue.	Ask the customer to use password reset or contact SabiCard support.
Card does not appear in dashboard	The card may belong to another seller or registration failed.	Search by Card UID. If missing, confirm credits and retry registration.

Do

- Register cards only for real customer transactions.
- Test every encoded card before release.
- Protect customer information.
- Use the official tap URL from the dashboard.
- Contact support for replacements or disputed activations.

Do Not

- Share your seller login with unauthorized users.
- Create customer accounts without customer consent.
- Reuse cards that are already activated.
- Encode misleading, unsafe, or unauthorized links.
- Continue selling after suspension or credit exhaustion.

Support Escalation

Contact SabiCard admin or support when any of these situations happen:

- Seller needs additional credits or credit adjustment.
- Wrong customer activated a card.
- A card is lost, defective, or needs replacement.
- NFC encoding repeatedly fails across supported devices.
- Customer reports duplicate activation or unauthorized card usage.
- Suspicious account, card, or activation activity appears.

Glossary

Card UID	The unique card identifier used by SabiCard.
Tap URL	The URL written to the physical NFC card.

**SabiCard**[Seller Guide](#)

Generated from live SabiCard screenshots		June 9, 2026
Registered Card	A card created in the seller dashboard but not necessarily activated by a customer.	
Activated Card	A registered card that has been claimed by a customer account.	
NFC Encoding	Writing the SabiCard tap URL to the physical NFC tag or card.	
Customer Account	The end user's personal SabiCard account.	

Seller Approval

Seller access is granted by SabiCard. A normal user account does not automatically receive seller privileges. SabiCard may approve, reject, suspend, or reactivate seller access based on platform policy.

Credit Usage

One successful card registration consumes one seller credit. Credits are deducted when the card is registered in the platform, before the card is sold or activated by a customer.

Card Responsibility

The seller is responsible for encoding the correct tap URL to the correct physical NFC card. The seller must verify the card after encoding before giving it to a customer.

Customer Ownership

Customers create and manage their own accounts. Sellers must not create customer accounts without consent, collect passwords, or impersonate customers.

Acceptable Use

Sellers must not use SabiCard for spam, fraud, misleading claims, unauthorized reselling, malicious links, or content that violates applicable law or platform rules.

Support and Adjustments

Credit adjustments, replacement cards, disputed activations, and ownership transfer requests are subject to SabiCard review. SabiCard may inspect ledger history and card activity when resolving support cases.

Suspension

SabiCard may suspend seller card creation for abuse, suspicious activity, unpaid usage, customer complaints, or violation of these conditions. Existing active customer cards may remain available unless security requires otherwise.

Data Privacy

Sellers can monitor cards and related activation details available in their dashboard. Sellers must protect customer information and use it only for legitimate card support and service purposes.
